RESEARCH INTEREST

My research focuses on developing **principled and adaptable intelligence** for autonomous systems operating in **high-stakes environments** where errors carry significant cost and adaptability is essential. I aim to bridge the gap between powerful simulation-trained agents and the unpredictable demands of the real world by unifying **reinforcement learning (RL)** with **vision-language models (VLM)** to enable systems that **reason, adapt, and act** under uncertainty. This work advances both **generalization and sample efficiency** in decision-making and integrates learning with structured reasoning to produce agents capable of grounded, interactive behaviors. These contributions drive **real-world impact** in domains such as **burn diagnosis through medical imaging** and **emergency medical robotics**, where systems must perceive affordances and improvise actions in unstructured, rapidly evolving conditions.
